

Know Your Septic System — Components, Functions and Best Management Practices

Household Plumbing

Functions

- Transports used water to septic system.
- Delivers wastewater to septic tank and soil treatment area.

Best Management Practices

- Control water use—repair leaks, use low-water-use appliances and fixtures.
- Don't overload the system—spread water usage throughout the day and week.
- Minimize use of harsh cleaners, bleach, antibacterial soaps and detergents.
- Do not dispose of paints, medications, or chemicals through your septic system.
- Keep grease, lint, food, feminine hygiene and plastic products out of your septic system.

Septic Tank

Functions

- Separates solids from liquid.
- Allows friendly bacteria to decompose organic solids.
- Stores solids until removed by pumping.
- Delivers liquid to soil treatment area.

Best Management Practices

- Never enter the septic tank.
- Pump/clean solids from tank's manhole (not inspection pipes) regularly.
- Have baffles inspected at time of cleaning.
- Install and insulate risers to manhole access.
- Identify whether your tank has an effluent screen, and service as necessary.
- Do not use septic tank additives or cleaners.

Household wastewater contains bacteria, viruses, nutrients, solids, and cleaners that need to be treated by your onsite sewage treatment system!

Trench Septic System

Mound Septic System

Soil Treatment System

Functions

- Removes bacteria, viruses, and other disease-causing organisms.
- Removes phosphorus.
- Reduces nitrogen content.
- Recycles water and nutrients through evaporation, plant uptake and groundwater recharge.

Best Management Practices

- Maintain vegetative cover (turf grass, native grasses or flowers). Mow, but do not fertilize, water, or burn.
- Keep heavy vehicles off area (cars, tractors, snowmobiles, etc.).
- Do not plant trees, shrubs or deep rooted plants on or close to this area.
- Do not grow vegetables or situate play areas above soil treatment area.
- Help prevent system freezing:
 - Inspect for cracked or missing inspection pipe covers annually.
 - Place mulch, straw or other insulating cover above soil treatment area for winter.
 - Maintain normal daily water use over the course of the winter.
 - Consider insulating cold air access points.
 - If you are gone for extended periods, arrange for someone to use water in your home or have your tank pumped.

Improperly Treated Sewage Can Threaten Human Health and the Environment

When septic systems fail, human and environmental health may be compromised.

System failure may be identified by one or more of the following:

- ✓ Sewage backup into the house
- ✓ Sewage surfacing in the yard or a ditch
- ✓ Sewage odors indoors or outdoors
- ✓ High levels of nitrates or coliform bacteria in well water tests
- ✓ Sounding of system alarms
- ✓ Algae blooms and excessive plant growth in nearby ponds or lakes

System failure most commonly results from:

- ✓ Overuse of water in the home
- ✓ Lack of proper maintenance
- ✓ Improper system design or installation

Taking Care of Your Septic System

Management Basics

More than 30 percent of Minnesota's households use septic systems (onsite sewage treatment systems) to treat their wastewater.

Septic systems protect human health and the environment by safely recycling wastewater back into the environment.

While government regulation ensures proper design and installation of permitted septic systems, *you* are responsible for properly operating and maintaining your septic system to protect the public's health and the environment.
